

Wood burning fires and stoves

2020/2021

 Dik Geurts

Lovers of the real wood fire

The name Dik Geurts has been synonymous with craftsmanship and design ever since the company was founded, and over the past 40 years it has become a household name in the fireplace world. Since 2007 Dik Geurts has been fully integrated in DRU Verwarming B.V., an innovative company that has guaranteed top quality for centuries.

In addition to being designers, we at Dik Geurts are particularly fond of the real wood fire. In our factory in Duiven, The Netherlands, we work hard every day on the quality and ease of operation of our stoves and fires. With this brochure, we would like to show you how the combination of simplicity, experience and knowledge leads to beautiful fires and the most beautiful flames.

 **Dik Geurts**
Creation of flames

Save on wood,
fine dust and
the environment

All wood burning stoves and fires in the Dik Geurts range have a particularly high efficiency. A higher temperature is reached in these closed and clever woodburners, and as a result combustion is much more complete and efficient. Even residual soot particles are fully burned, so you save on wood, emit less particulate matter and soot particles, and thus protect the environment.

EcoDesign & Defra

From 1 January 2022, European legislation sets requirements for the minimum efficiency of a stove and the maximum emission of particulate matter. All our fires and stoves already comply with this legislation and carry the EcoDesign 2022 label. Several Dik Geurts fires and stoves are also Defra approved for UK smoke controlled areas. These can be recognised by the quality mark.

Climate neutral

In principle, heating with wood is CO₂ neutral. During the growth phase of a tree, CO₂ is absorbed from the air. When the tree is cut down and burned, the same amount of CO₂ is released into the atmosphere. In order to be able to remain climate neutral, sustainably sourced wood must be used. Therefore a new tree is planted for every tree that is cut down. This process ensures everything remains nicely in balance.

Energy label

The Dik Geurts wood burning stoves are provided with an energy efficiency label. The greener the label, the better it is for the environment. Our stoves are all in the A-class or better.

The right way to burn

The best setup

With the so-called 'Swiss method' you can burn wood safely and cleanly. At the bottom of the stove you should place large logs, on top of which you should put small pieces of wood, and on top of those, firelighters. Replenish the heating space when all that is left is a glow bed. Place a number of logs with the cleft side down in the fire box and open the air supply.

The right wood

The fuel must be sufficiently dry and suitable as firewood. Good firewood has a moisture percentage of 15%-20%. You should never burn waste wood such as chipboard or old railway sleepers, or treated wood. The combustion of waste or treated wood can produce toxic fumes. As well as being unsafe, this is also very harmful to the environment.

Scan the QR code for an explanation video about burning wood.

The right output

The output of a wood burning fire or stove must match the space you want to heat. If you have a fire with too much output, the room will soon become too hot. You will then not be able to let the fire burn to its full capacity and this can cause odour nuisance or extra pollution of the chimney. If the power is too low, you run the risk that the fire will not heat the room enough. This is especially annoying when the fire has an important function in the heating of your home. Dik Geurts offers a wide range of stoves and fires for larger and smaller rooms. Because Dik Geurts fires can also be fired at low power (4 kW), they are extremely suitable for use in spring or autumn.

kW (Output, indicated in kilo Watt).

External air

Insulation of houses is improving more and more these days. To ensure that sufficient fresh air enters the house, ventilation systems are often installed. Depending on the situation in your home, you may need a specific type of connection (EA or RS) to feed air to the fire. The Dik Geurts EA fires can be fitted with an outside air connection. This way hardly any oxygen is taken out of your house. There are also RS fires with an outside air connection, which take the air for combustion almost completely from outside. These fires are ideal for very modern, airtight houses.

EA ('External Air'), used in neutral or overpressure situations. The vast majority of oxygen for combustion comes from outside.

RS ('Room Sealed'), used for underpressure in the living room. Oxygen for combustion comes almost entirely from outside.

Calculate output

Calculate the content of the space you want to heat (length x width x height). Next, it is important to make get an idea of the extent to which your house is insulated. For example, do you have double-glazing and wall and floor insulation everywhere? Then your home belongs to type A. Is your home not optimally insulated, without double-glazing in every window? Then your home belongs to type B. Is your home poorly insulated and with no double-glazing? Then your home belongs to type C. Knowing this you can see in the graph below what capacity (in kilowatts) is needed to heat your home.

Warm heart for Uganda

At Dik Geurts we care for the world around us, and human beings also deserve our attention. In our project 'A fireplace for you, a future for her', part of the proceeds from our fires is used to provide women in Uganda with a microcredit for a tree plantation.

Thoughtful
technique,
simple
to use

A Dik Geurts wood stove is not just a cabinet in which you can burn wood. It is a thoughtfully-designed device that ensures efficient and clean combustion at a high efficiency. Our fires and stoves have a closed combustion chamber (so no grate) that provides good insulation, and the flue gases that are released during combustion are led outside via an ingenious labyrinth.

Simple operation

Dik Geurts fires and stoves are easy to operate. They have a single lever to regulate the surprisingly sophisticated air supply. Thanks to this, Dik Geurts fires and stoves ignite very easily.

Infrared glass

At Dik Geurts we use infrared glass for a number of our fires and stoves to circulate the heat in the fire box. This gives a higher efficiency, retains the heat in the fire and as a result the glass stays clean much longer.

IR (Infrared)

Vermiculite

The combustion chambers of all Dik Geurts fires are insulated with heat-retaining vermiculite. For a nice contrast with the yellow flames, the vermiculite in the combustion chamber of our design fires is coloured dark anthracite.

Floor plates

For a complete set-up and extra protection of the floor, we offer round, rectangular and square floor plates. Finished in dark anthracite steel and available in different sizes.

A Dik Geurts wood stove always has a high efficiency, low emissions of CO₂ and fine dust and ultimate fire control. Guaranteed.

Simple operation: just one lever

Optional floor plate

A close-up, artistic photograph of a modern fireplace. The fireplace has a curved, metallic frame with a dark, possibly black, inner lining. A fire is burning brightly inside, with orange and yellow flames rising from a bed of dark, charred wood. The background is dark and out of focus. The overall mood is warm and sophisticated.

Design fires

The eye-catcher
for every interior

A design fire gives your home character and can be the beating heart of any interior. The Dik Geurts design fires can seem to float in space and at the same time form a natural unity with the rest of the room.

Custom-made solutions

The Dik Geurts product options are extensive. Yet it may be that nothing fits. The opening is too high, deep or indeed too shallow. But, there is a solution! We can produce a custom-made insert fire for you at a small additional charge. Sometimes all that's needed is a small modification to the frame. The custom-made fires are available in front, corner, triple and tunnel models.

Operating procedure

Your Dik Geurts dealer will take all the necessary measurements and will complete the special custom-made form. We will then draw the fire as per the requested dimensions. Once this has been verified, we commence production of your custom-made fire. Delivery time on average is 4-6 weeks.

Easy installation of the Instyle and Prostyle fires

The various connection options ensure that the stove is quick and easy to install, regardless of the installation situation. There are four options for flue gas extraction, for exact dimensions see page 73.

1. Connection without drain material to an existing chimney flue (sealing with ceramic wool)
2. Connection with flexible or fixed pipe (**Liner Kit Pro**), Ø 150 or 180 mm
3. Connection with rejuvenated pipe (**connection piece**), Ø 150 or 180 mm

External air kit

Kit for supply of fresh air from outside.

- Ideal for fully insulated houses
- Optional at 500
- 1000V, 600V - 1000V, Tunnel (only base)
- For rear and base connection
- Dimensions: Ø 80 mm

Linerkit Pro

Connection piece for flexible or rigid pipe.

- Optional with: 500 - 1000, 600V - 1000V, Corner, Triple, Tunnel
- Connectable from the inside of the fire
- Reducer with 3 screw holes
- Dimensions: Ø 150 mm, Ø 180 mm

Connection piece

Connection piece for rejuvenated pipe.

- Optional at: 500 - 1000, 600V - 1000V, Corner, Triple, Tunnel
- Reducer with 3 screw holes
- Dimensions: Ø 150 mm, Ø 180 mm

Convection kit

Connecting rings (2 pieces) for mounting on the convection holes.

- Optional with: 500 - 1000, 600V - 1000V, Tunnel
- For more heating power
- Dimensions: Ø 125 mm

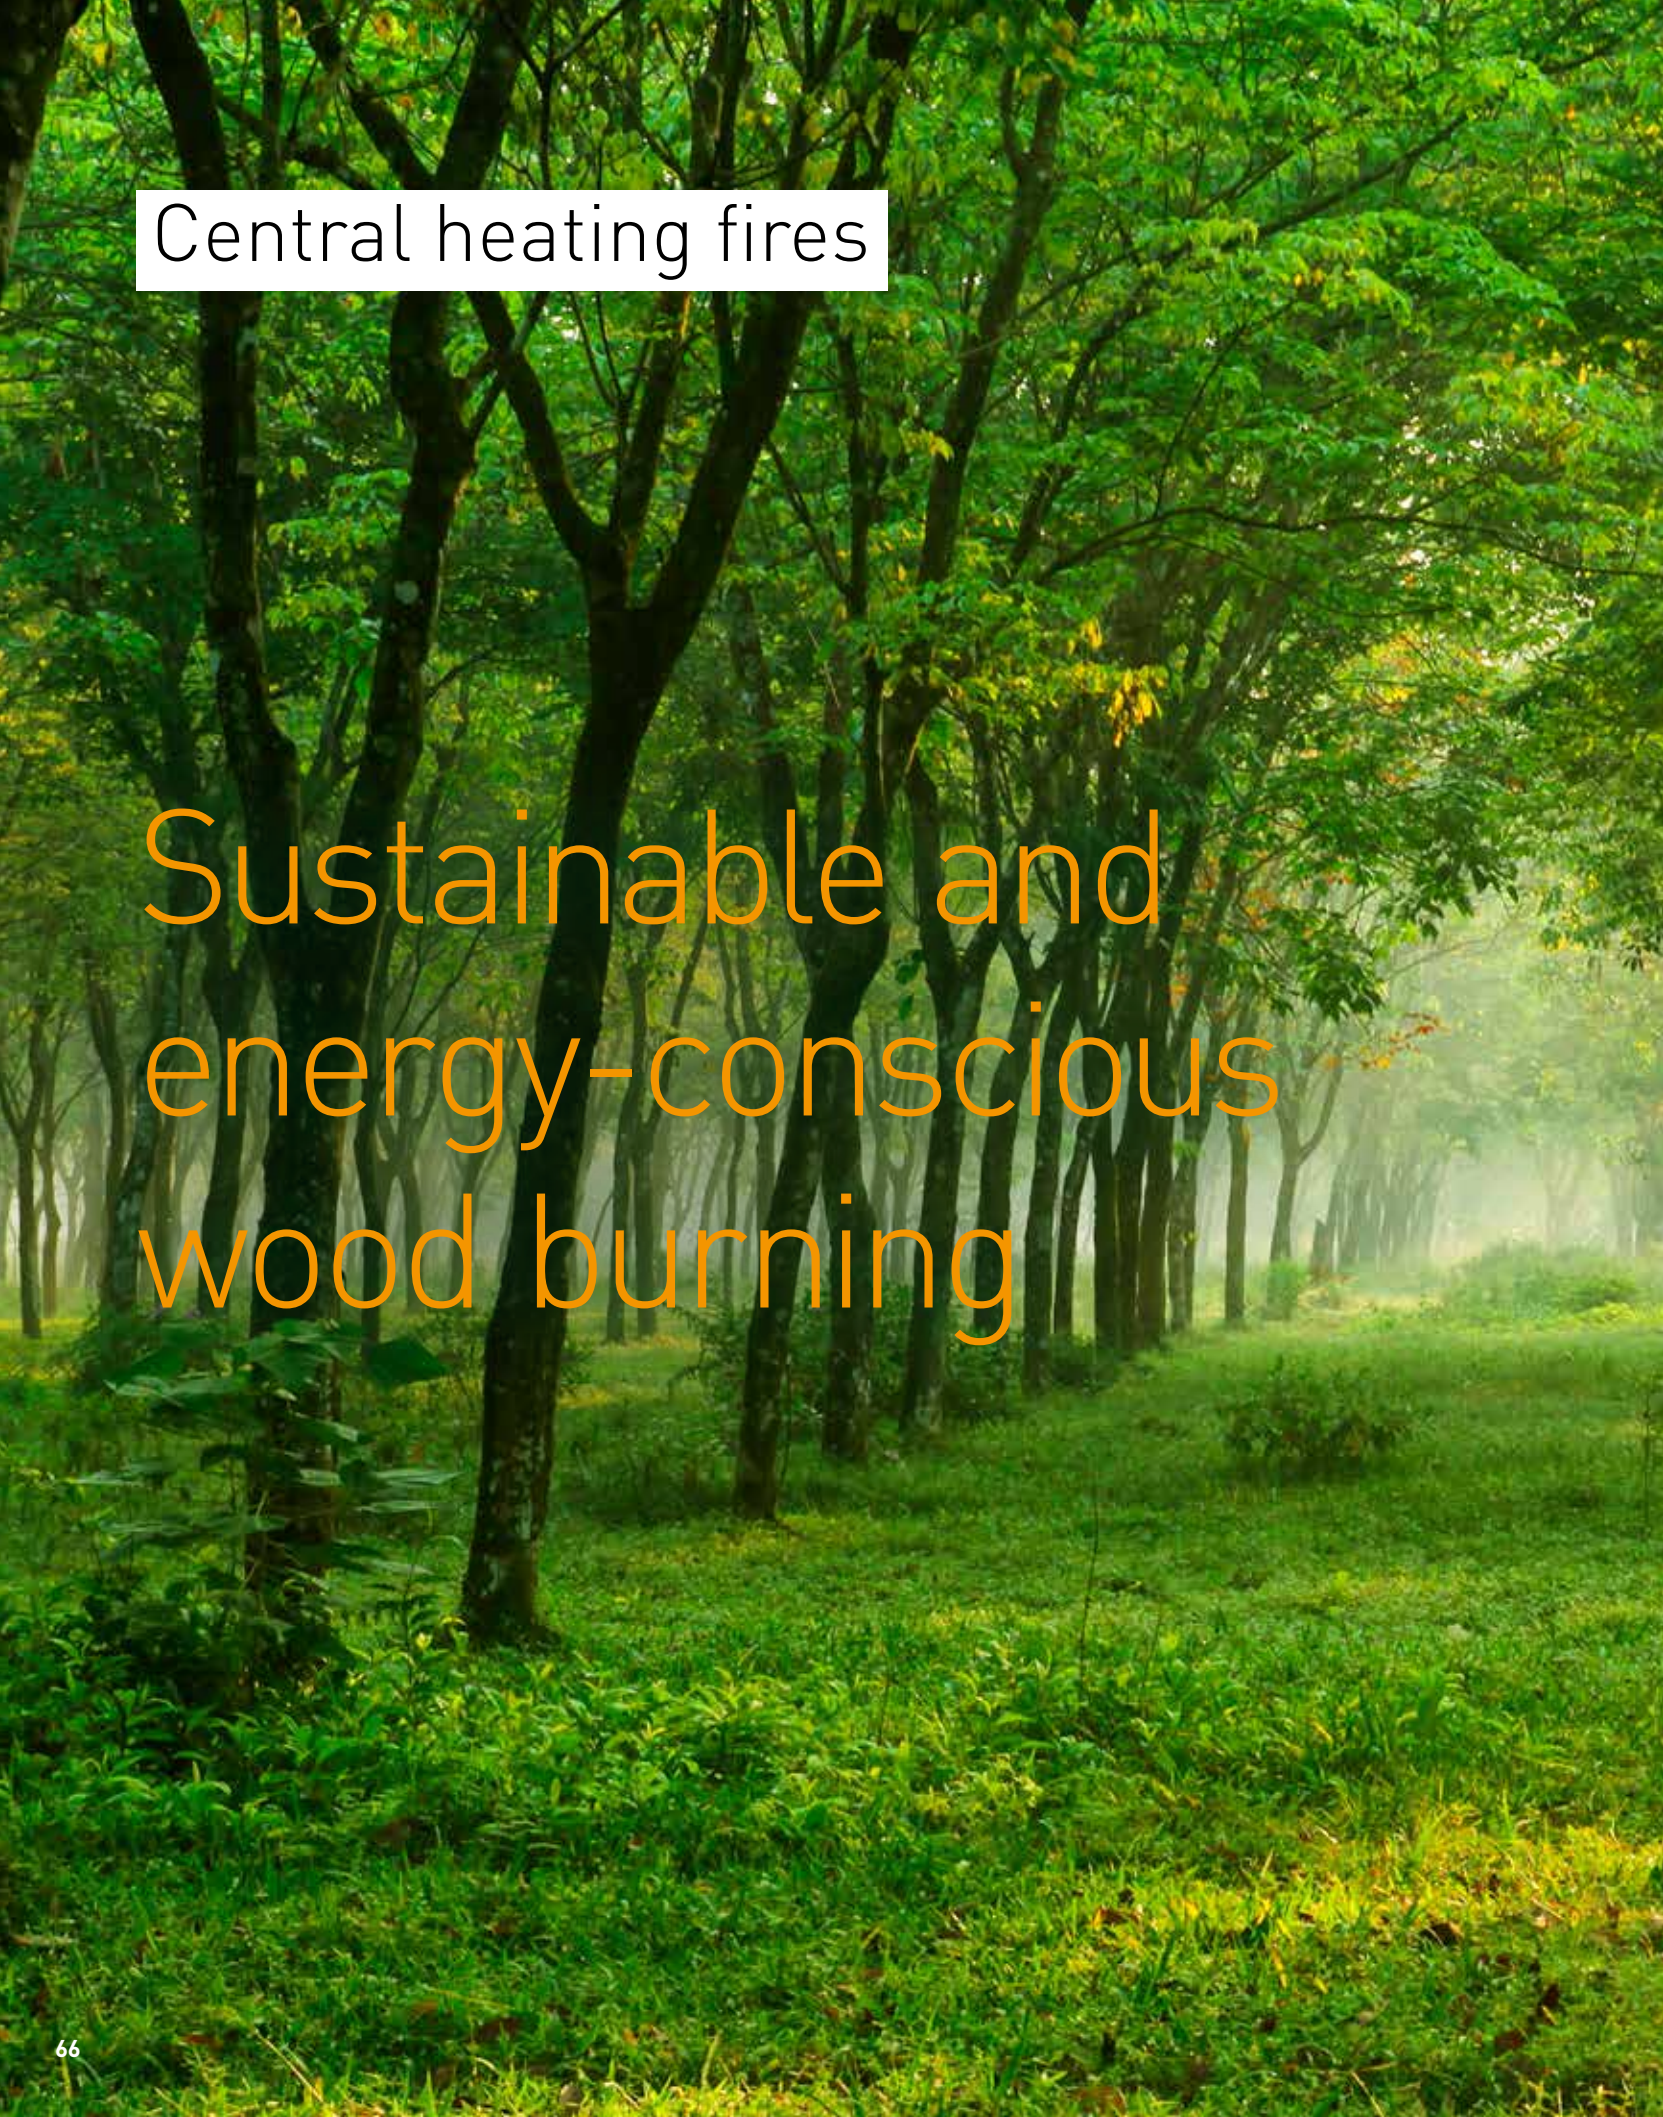

Easy air control

- At the front of the fire
- Both Instyle and Prostyle finishes

Door lock

- Stable and flexible door closure
- The cord ensures a good seal
- The door is adjustable and exchangeable
- Kit for self-closing door optional for Instyle 500-1000 series and Instyle Tunnel

A photograph of a misty forest. Tall, slender trees with green foliage stand in a row, receding into the distance. The ground is covered in lush green grass and low-lying plants. A soft, white mist hangs between the trees, creating a serene and atmospheric scene. The lighting is soft, suggesting an early morning or late afternoon setting.

Central heating fires

Sustainable and energy-conscious wood burning

Green Design stands for sustainable, environmentally friendly and energy-conscious heating of fires and stoves connected to a central heating system.

Dik Geurts also supplies fires that you can connect to a central heating system, an environmentally friendly alternative way to heat your home. With these fires the hot flue gases are used to heat the water for your central heating system. Doing this means you get more efficiency from your fire or stove, resulting in a lower energy bill – and it's also sustainable.

- Environmentally friendly heating
- Durable/lower energy usage
- Suitable for any type of home
- Can be combined with solar panels and heat pumps
- Lower energy bill
- Maintenance friendly

More info

If you want to know more about Green Design or the operation of central heating fireplaces, go to www.drufire.com. There you can also download a special Green Design brochure.
